Alcona and Alpena County, MI Coastal Hazard Analysis Flood Risk Review Meeting

June 25, 2018

FEMA

Agenda

- Introductions
- Coastal Flood Risk Study and Mapping Program
- Current Status
- Technical Overview of Study and Mapping
- Floodplain Management
- Next Steps
- Q&A
- Workmap Review

Alcona and Alpena County, MI

COASTAL FLOOD RISK STUDY AND MAPPING PROGRAM

Great Lakes Flood Study

- Comprehensive study of the Coastal Great Lakes flood hazards
- Latest technology, data, and models – including response based modelling concepts

Partners involved:

FEMA

US Army Corps of Engineers ®
Detroit District

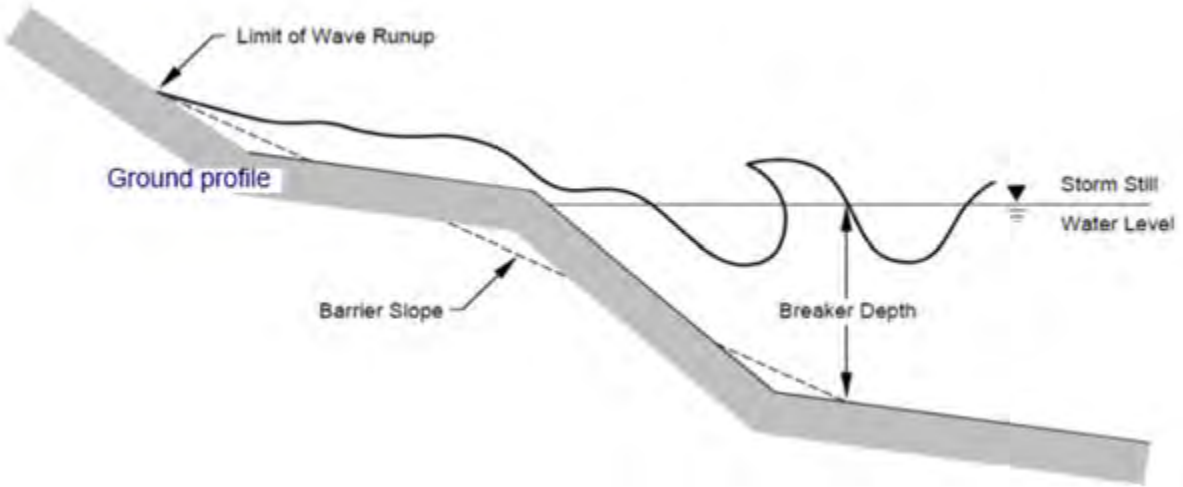
ERDC

RAMPP

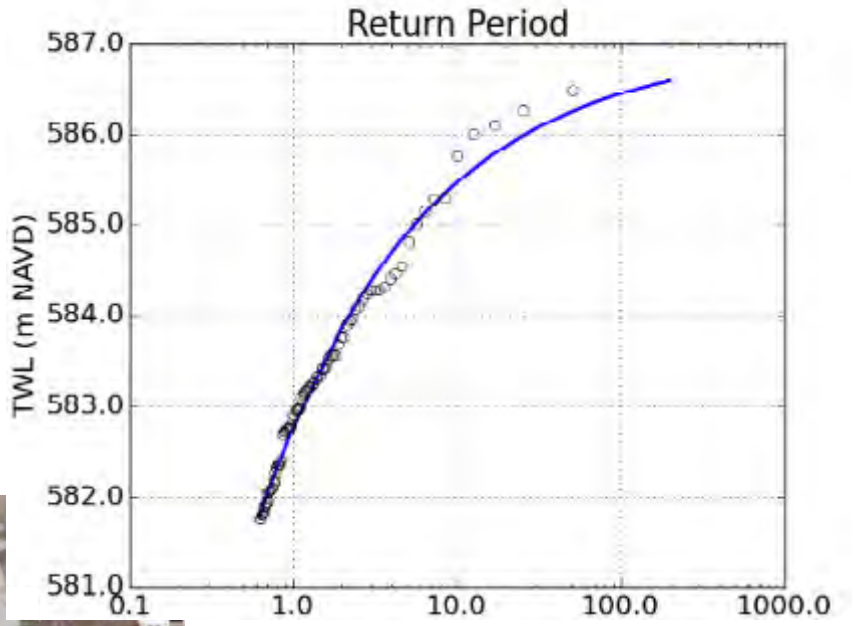
STARR
Strategic Alliance for Risk Reduction

Response-Based Wave Runup

- Wave runup is the uprush of water from wave action on a beach, steep bluff or coastal structure.
- Calculated at each transect using appropriate hydrodynamic equations that simulate events for every time step captured for selected storms using lake-wide gridded record (ADCIRC-SWAN)
- Statistical analysis is performed on the maximum runup results at each transect to obtain the 1-percent-annual-chance runup elevation.



Response-Based Wave Runup



FEMA's Risk MAP Program

Risk Mapping, Assessment, and Planning …

- Will deliver quality data to increase public awareness and lead to action that reduces risk to life and property
- New non-regulatory products and datasets

Mapping Assessment Planning

Mitigation Actions: A Shared Responsibility

STRUCTURE AND INFRASTRUCTURE PROJECTS

- Acquisition
- Elevation
- Revetments and Seawalls
- Breakwater

LOCAL PLAN AND REGULATIONS

- Zoning
- Building Codes
- Open Space Plan
- Lake Front Development Master Plan

CITIZEN AND BUSINESS ENGAGEMENT

- Firewise
- StormReady
- NFIP and CRS

NATURAL SYSTEM PROTECTION

- Vegetation management
- Wetland restoration
- Erosion control

Alcona and Alpena County

CURRENT STATUS REVIEW

Analyses/Mapping: Grouping

Blue: Phase 1

- Huron
- Arenac
- Iosco
- Sanilac
- St Clair

Grey: Standalone

- Bay

Green: Phase 2

- Alcona
- Alpena
- Presque Isle
- Cheboygan
- Mackinac

- FRR Meetings fall at the end of a multi-year study including sophisticated modeling
- Next, the maps and data will be put into the official regulatory format

Great Lakes Coastal Flood Study

Coastal Flood Hazard Study Result Summary
Alcona County, Michigan

Water Level and Offshore Wave Conditions

The Great Lakes Coastal Flood Study (GLCFS) is a collaboration of the Federal Emergency Management Agency (FEMA), the U.S. Army Corps of Engineers Engineering Research and Data Center (USACE - ERDC), State partners, the Association of State Floodplain Management and FEMA contractors to establish technically sound processes for updating data on Great Lakes Coastal flood hazards. As part of the GLCFS, USACE-ERDC performed Storm Surge analysis for Lake Huron. The storm surge analyses were performed using 50 years of historical records (hindcast storm analysis) including meteorological, water level, and ice field data. In order to capture the interaction between storm surge and the generation and propagation of waves, FEMA contractors repeated the hindcast storm analysis including a two-dimensional (2-D) wave model. A scientifically valid statistical analysis was used to analyze the modeled water levels and waves to determine the wave and water level combinations that pose the greatest potential flood hazard along the coastline. The storm surge and wave models were validated against measured water levels from the National Ocean and Atmospheric Administration National Ocean Service long-term measurement stations for the 50-year historical storm record. The offshore storm surge and wave conditions were then used in site specific (county level) analyses to establish BFEs along the coastline.

Nearshore Wave Impacts

In sheltered areas when waves are not present, water levels from the hindcast storm analysis are statistically evaluated to calculate the BFE. In areas where waves are present, the characteristics of the shoreline are considered to determine the type of impact. Per FEMA guidance, contractors use one dimensional (1-D) models to evaluate nearshore flood hazards in coastal areas. These 1-D models require cross-sectional treatment of the shoreline, commonly referred to as transects. In addition to several additional transects, as required to resolve local shoreline and wave characters, 11 published transect locations were used for the coastal flood hazard analysis for Alcona County's 28.6-mile long Lake Huron coastline. Transects representing reaches of similar physical characteristics were located perpendicular to the shoreline orientation along areas subject to coastal flooding.

Glossary of Terms

1-Percent-Annual-Chance Flood: A flood that has a 1-percent chance of being equaled or exceeded in any given year. It is also referred to as the base flood or 100-year flood.

Base Flood Elevation (BFE): The computed elevation to which floodwater is anticipated to rise during the base flood with wave effects included in coastal areas. The BFE, flood hazard zone, and a structure's elevation are factors in determining the flood insurance premium.

Flood Insurance Rate Map (FIRM): The official map of a community showing the BFEs, Special Flood Hazard Areas and the flood insurance premium zones.

Special Flood Hazard Area (SFHA): The area shown as inundated by the floodwaters of the base flood on FIRMs where floodplain management regulations must be enforced and mandatory flood insurance purchase requirements apply.

Coastal High Hazard Area (CHHA) or VE Zone: An SFHA extending from offshore to the inland limit of a primary frontal dune along an open coast and any other area subject to high-velocity wave action from storms.

Alcona and Alpena County

TECHNICAL OVERVIEW OF STUDY AND MAPPING

Coastal Flood Hazard Modeling Overview

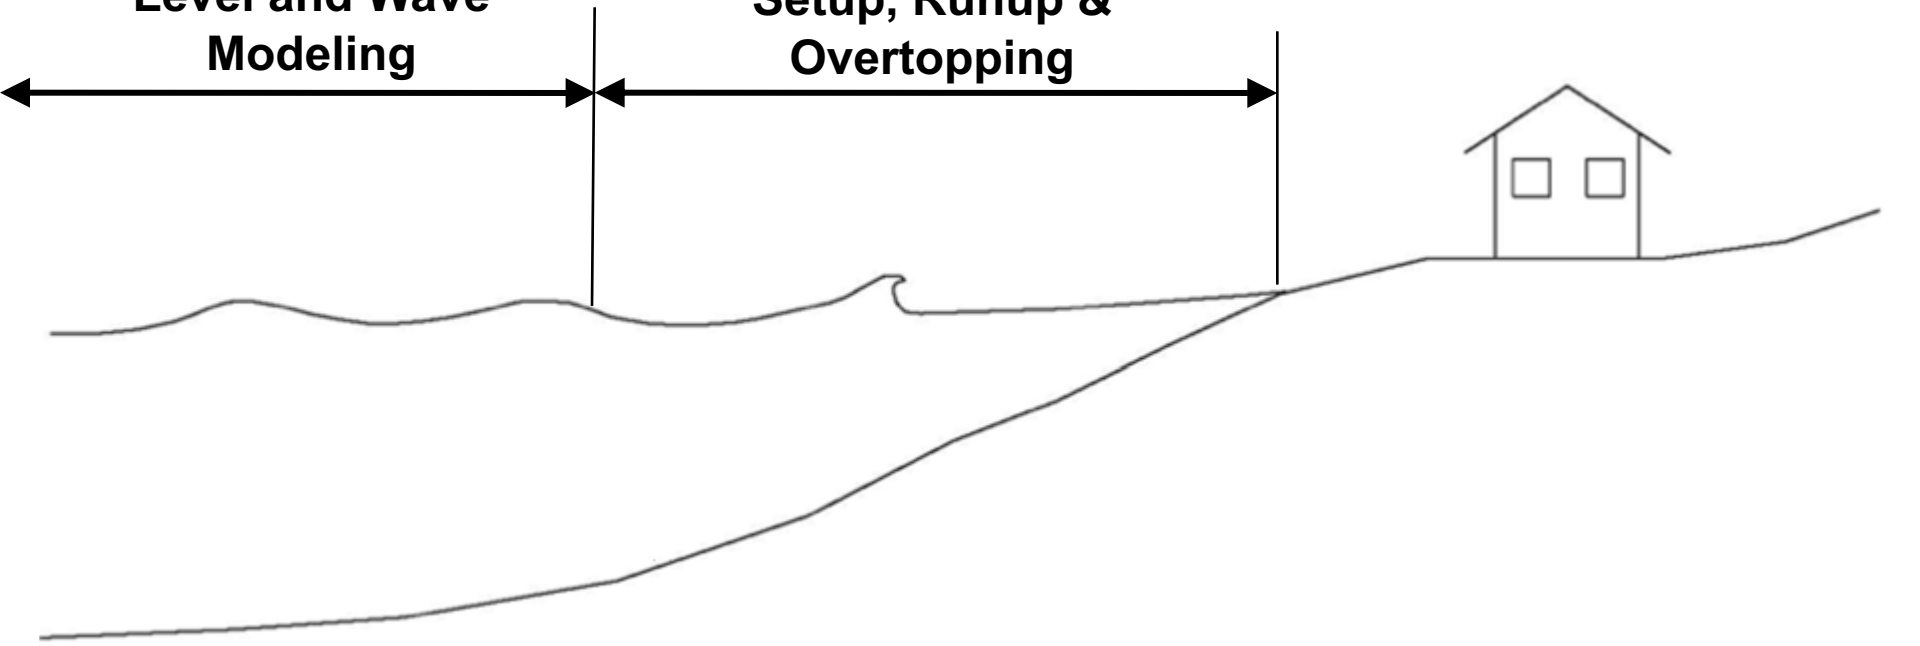
Lake-Wide Variation

Local Variation

Step 1: Offshore Water Level and Wave Modeling

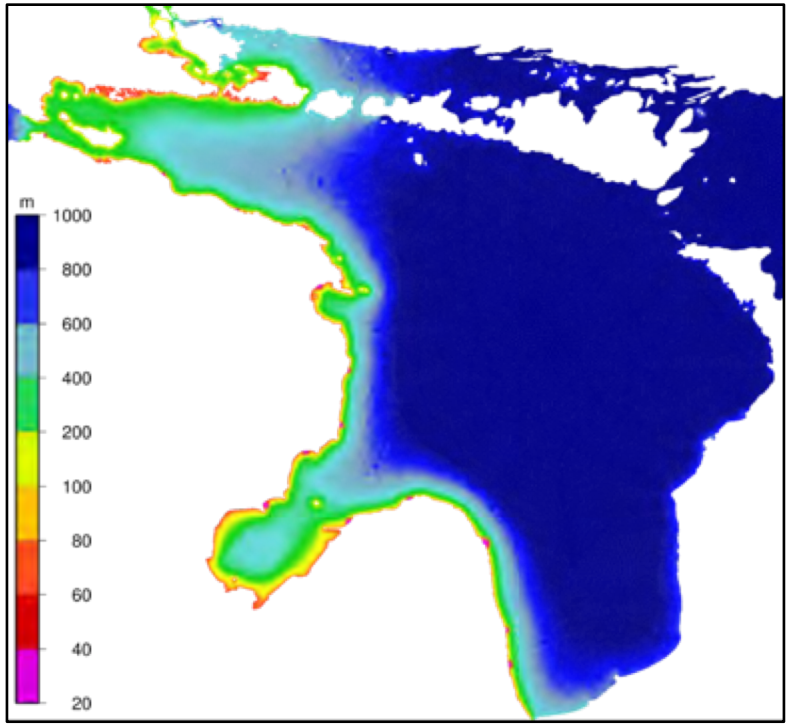
Step 2: Nearshore Wave Setup, Runup & Overtopping

Step 3: Floodplain Mapping



Step 1: ADCIRC+SWAN Mesh

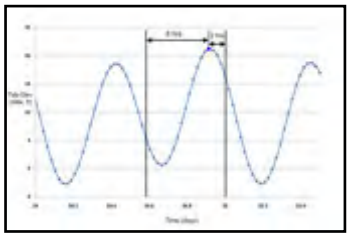
- Resolution as fine as 10 m along complex shoreline features including:
  - Jetties
  - Inlets
  - Breakwaters
  - Natural Shoals



Step 1: Run the Models

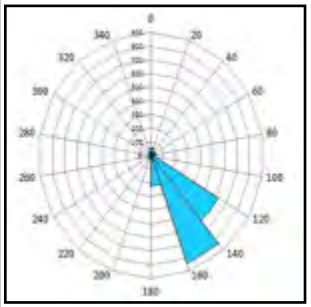
Baseline

Water Level

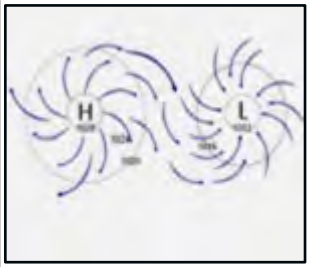


Meteorological Forcing

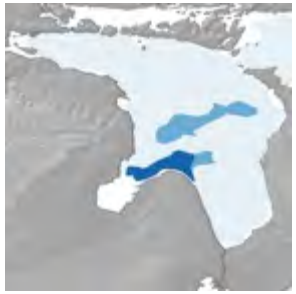
Wind



Pressure

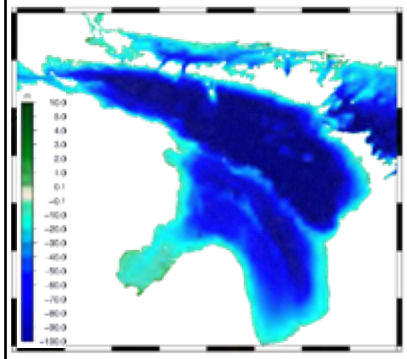


Ice

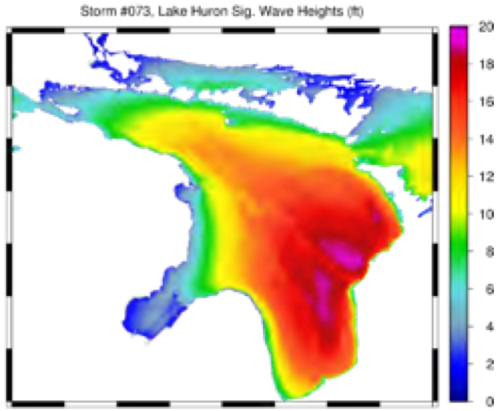


Physical Setting

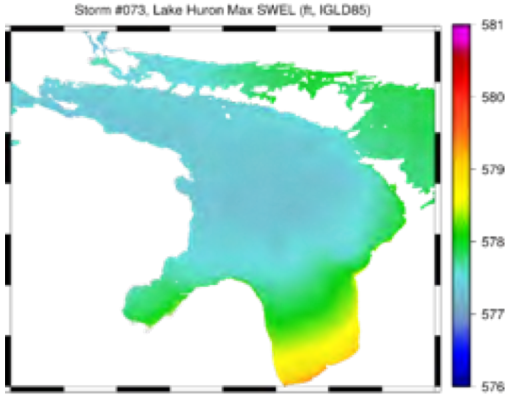
Bathymetry



Waves



Still Water Elevations

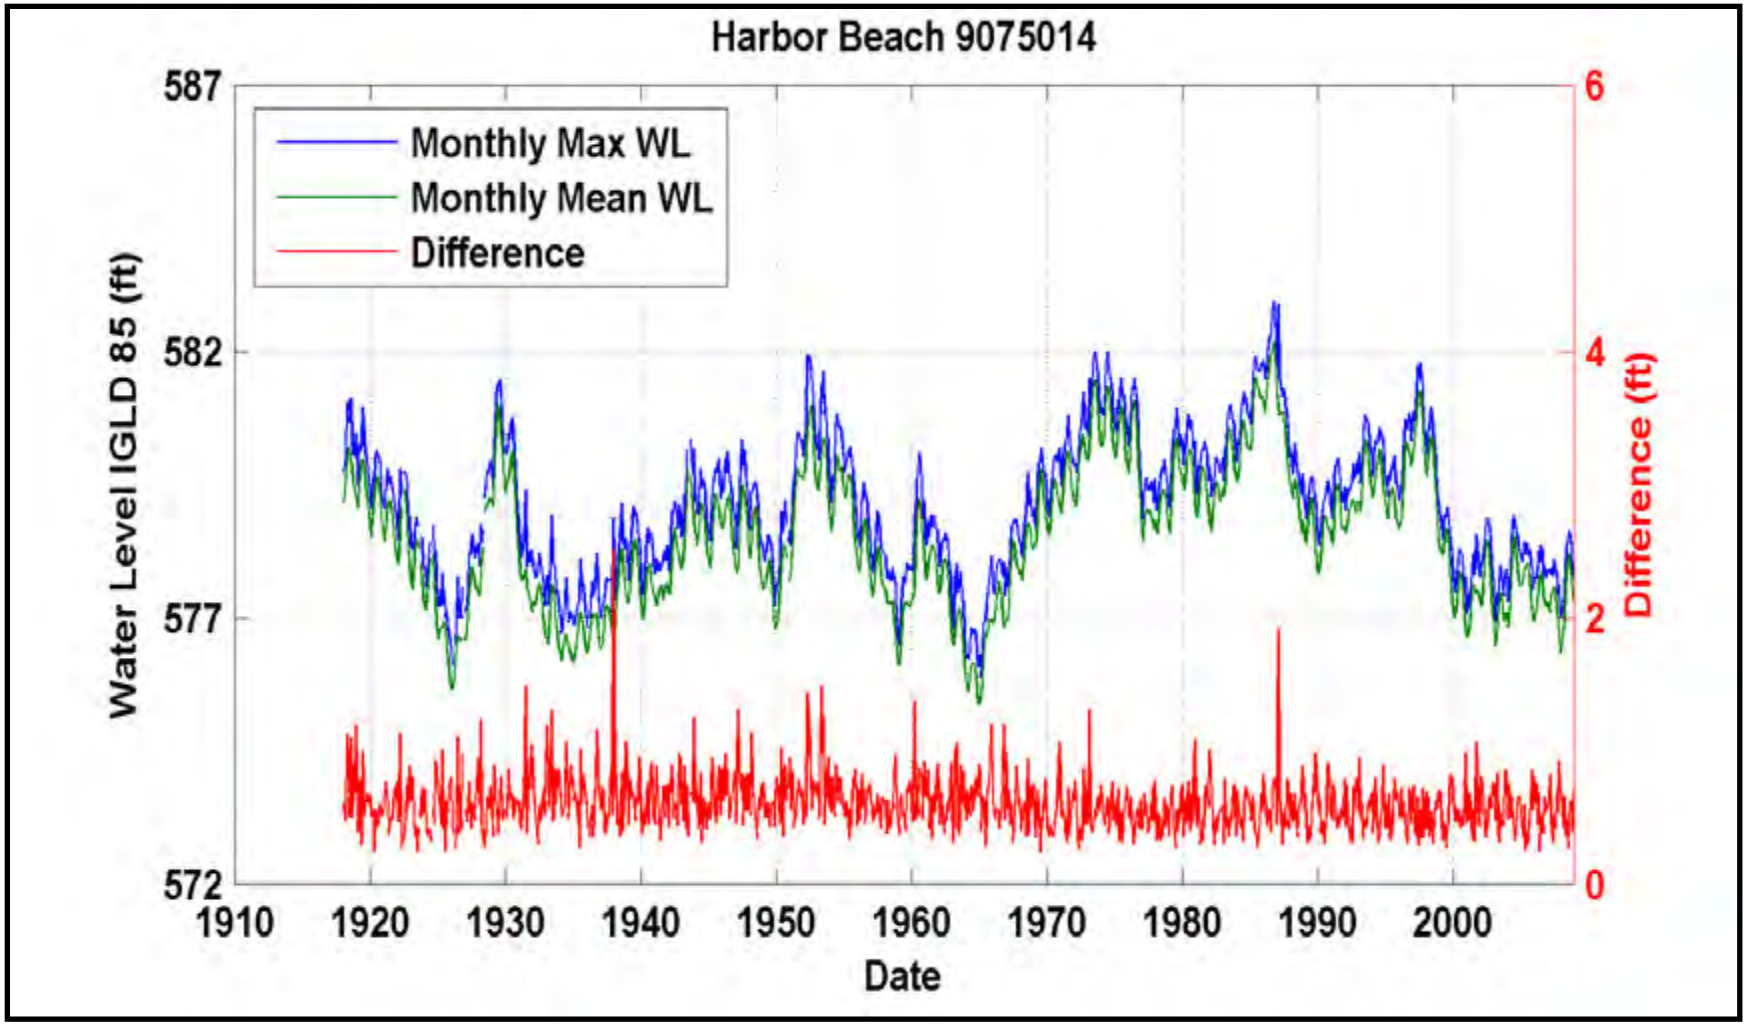


Total of 151 events between 1960-2009

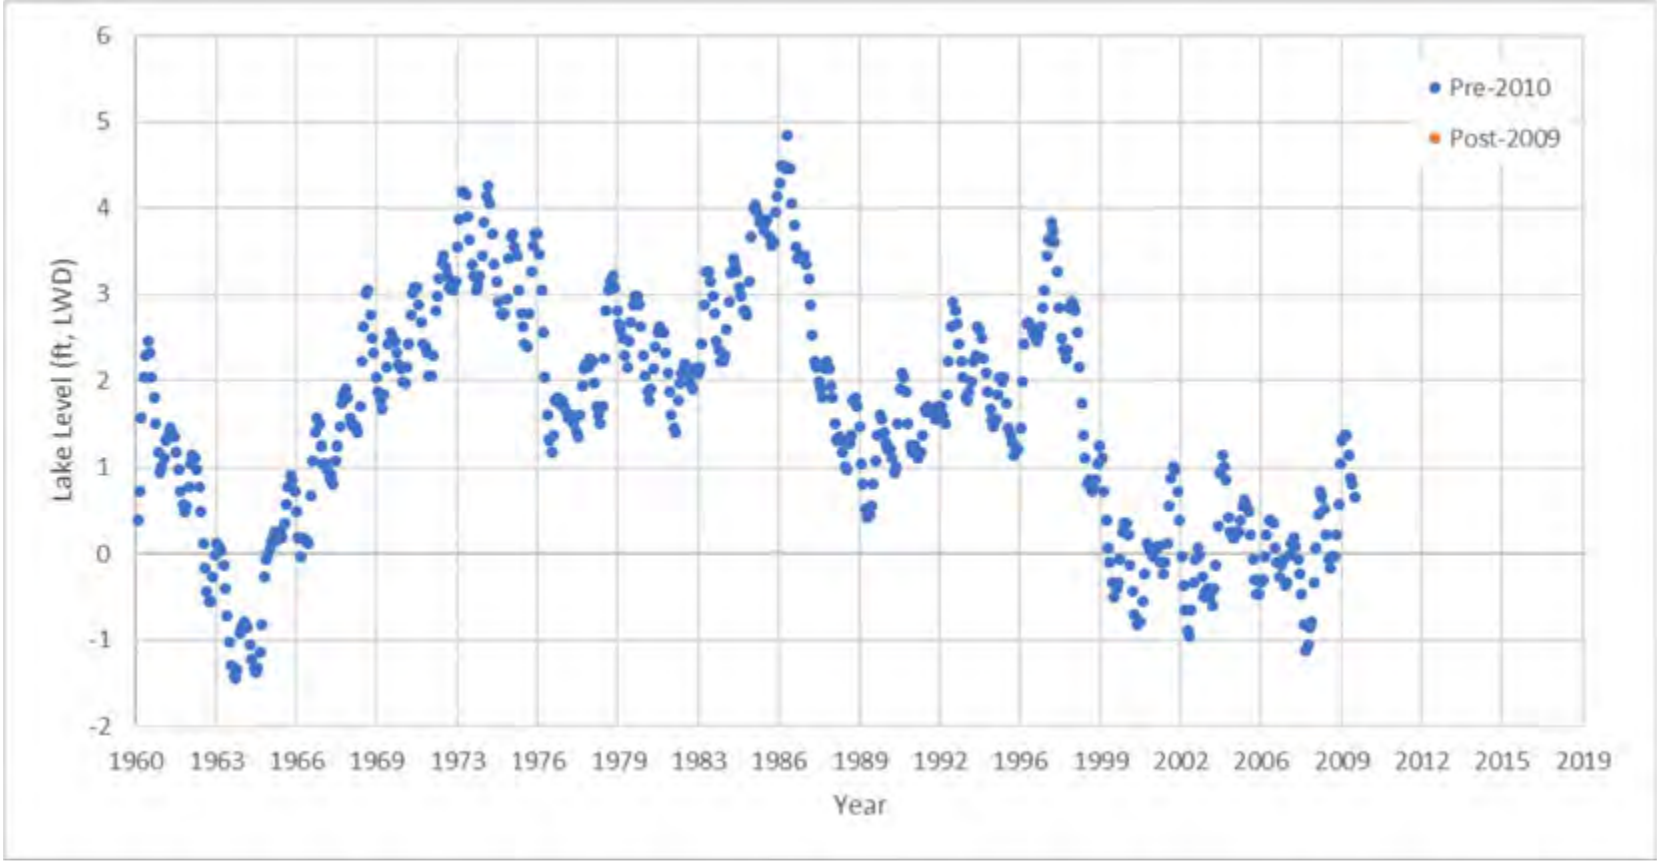
FEMA

RiskMAP
Increasing Resilience Together

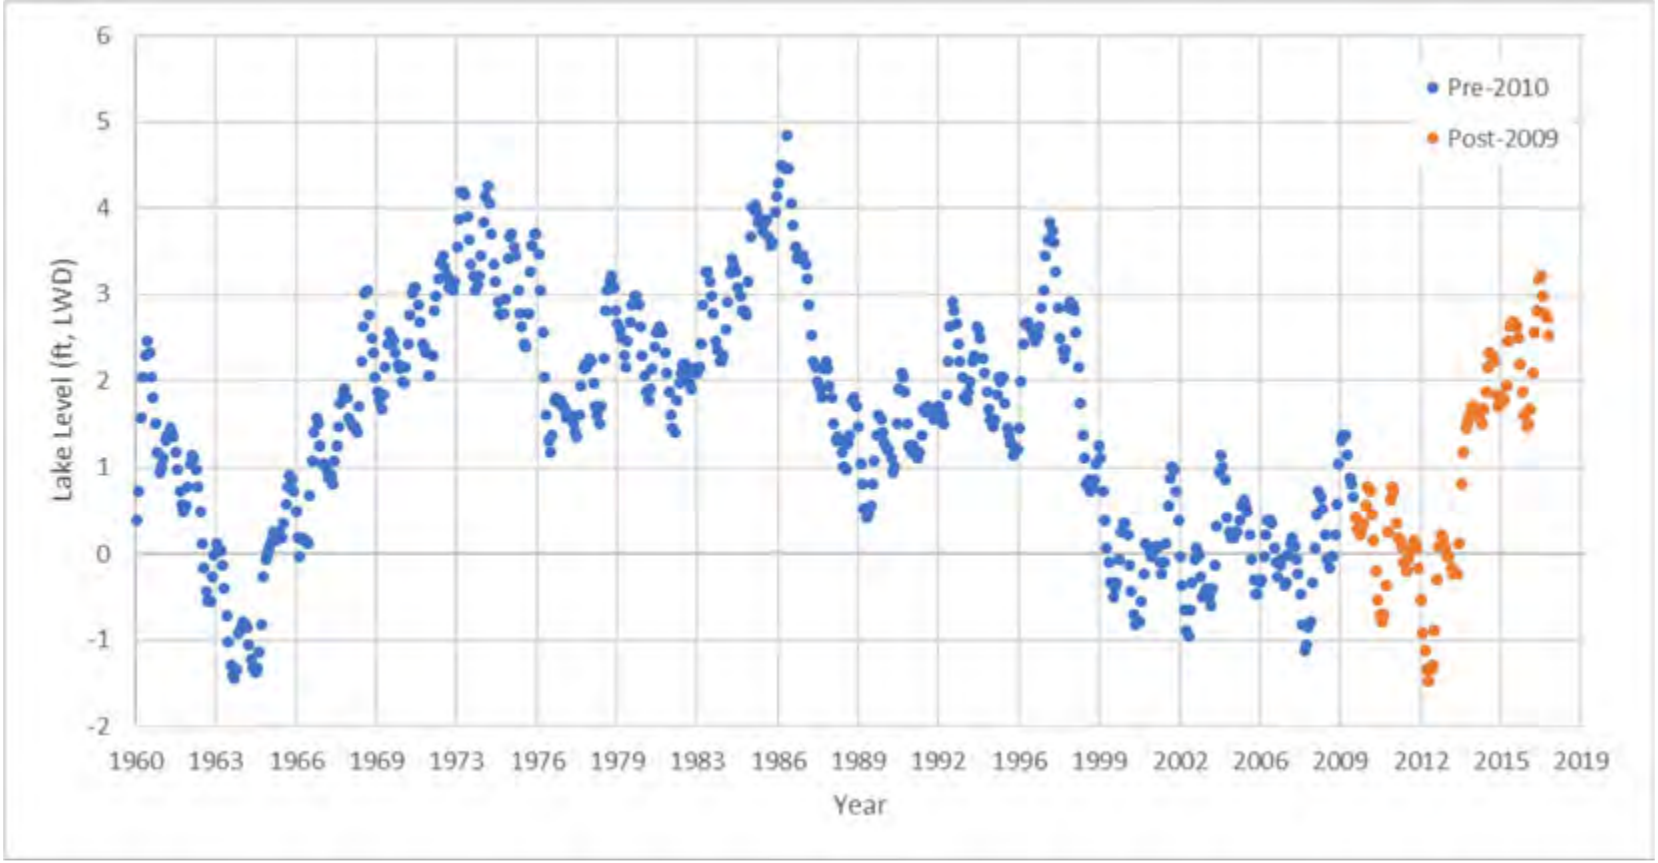
Step 1: Lake Levels



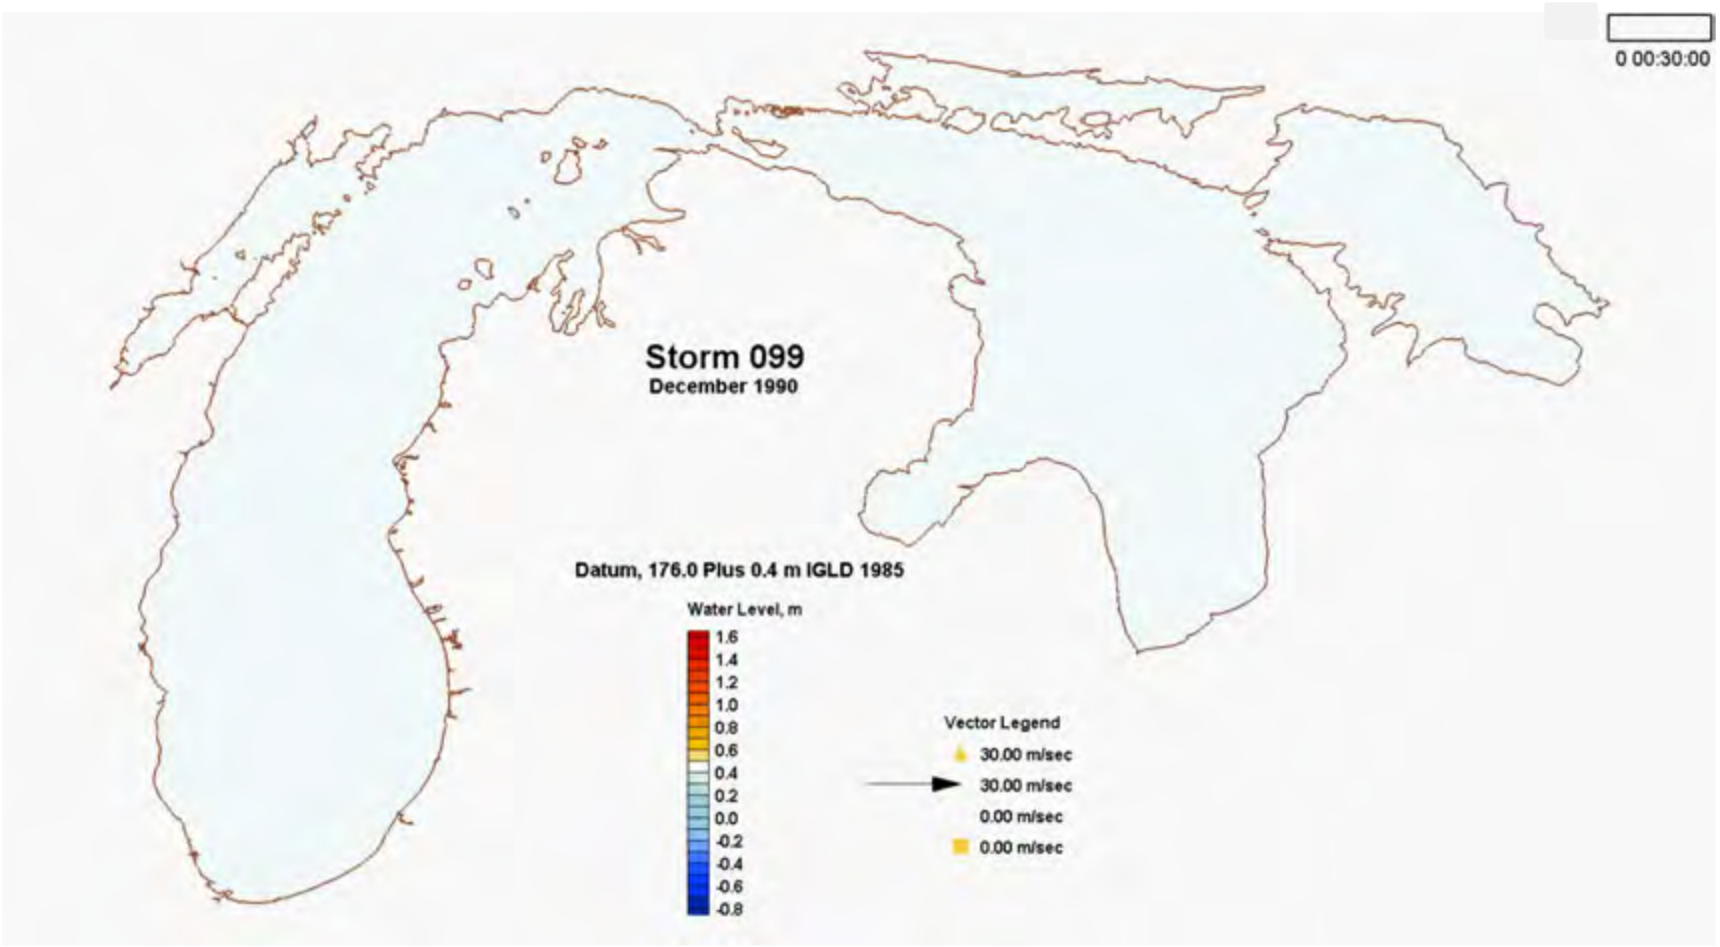
Step 1: Lake Levels



Step 1: Lake Levels



Step 1: Example Surge Behavior



Step 1: Model Accuracy Assessment

Water Level Gauge Station		RMS error (m)	Bias (m)
9075014	Harbor Beach	0.054	0.018
9075080	Mackinaw City	0.061	0.011
9075099	De Tour Village	0.051	0.026
9014098	Fort Gratiot	0.106	0.069
9075002	Lakeport	0.072	0.011
9075035	Essexville	0.103	-0.003
9075059	Harrisville	0.054	0.027
Average		0.071	0.023

Wave Buoy Station		RMS error (m)	Bias (m)
45003	North Lake Huron	0.317	-0.024
45008	South Lake Huron	0.310	0.051
Average		0.313	0.014

Step 2: Nearshore Wave-Induced Flood Hazards

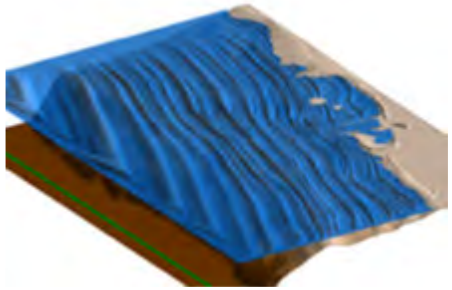
Nearshore Wave-Induced Flood Hazards Analysis includes:

- Shoreline classification
- 2-D Wave and Surge Model data extraction
- Wave setup
- Erosion
- Evaluation of coastal structures
- Wave runup
- Wave overtopping
- Overland wave propagation
- Statistical analysis

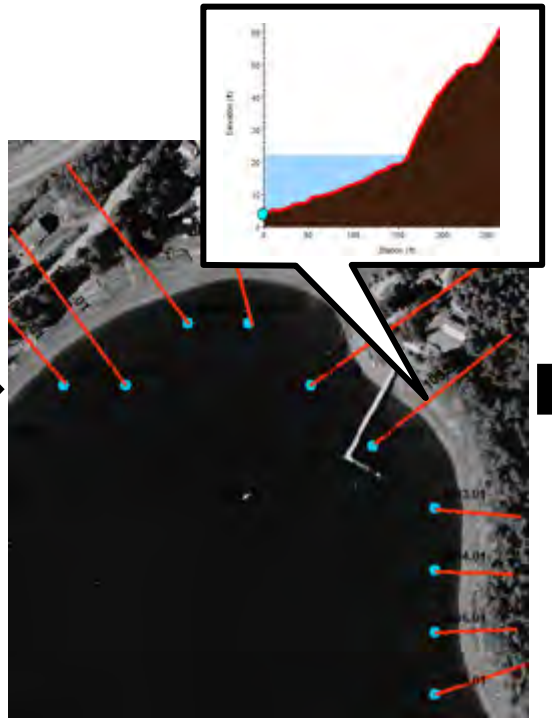
→ Along 1-D Transects

Step 2: Transect Analysis Overview

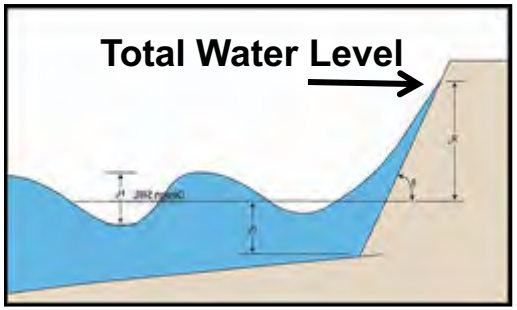
Water Level & Offshore Waves



Transect Analysis



Total Water Level



Total Water Level

- Water Level (Surge)
- Waves
- Setup, Runup and Overtopping

Step 2: Transect Layout

- Alcona County:
  - 11 Published Transects
  - 122 Analysis Transects
  - 29 Shoreline Miles
- Transects placed at representative shoreline reaches based on:
  - Topography
  - Exposure
  - Shoreline Material
  - Upland Development

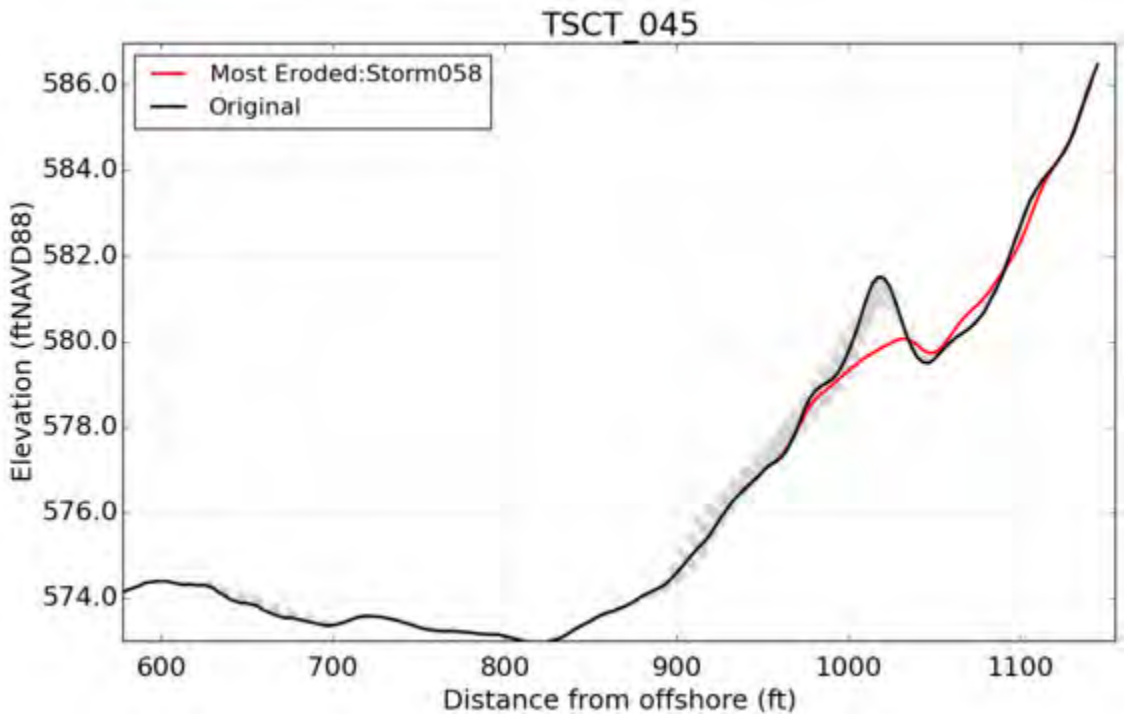
Step 2: Transect Layout

- Alpena County:
  - 22 Published Transects
  - 139 Analysis Transects
  - 80 Shoreline Miles
- Transects placed at representative shoreline reaches based on:
  - Topography
  - Exposure
  - Shoreline Material
  - Upland Development

Step 2: Eroded Transect Profiles

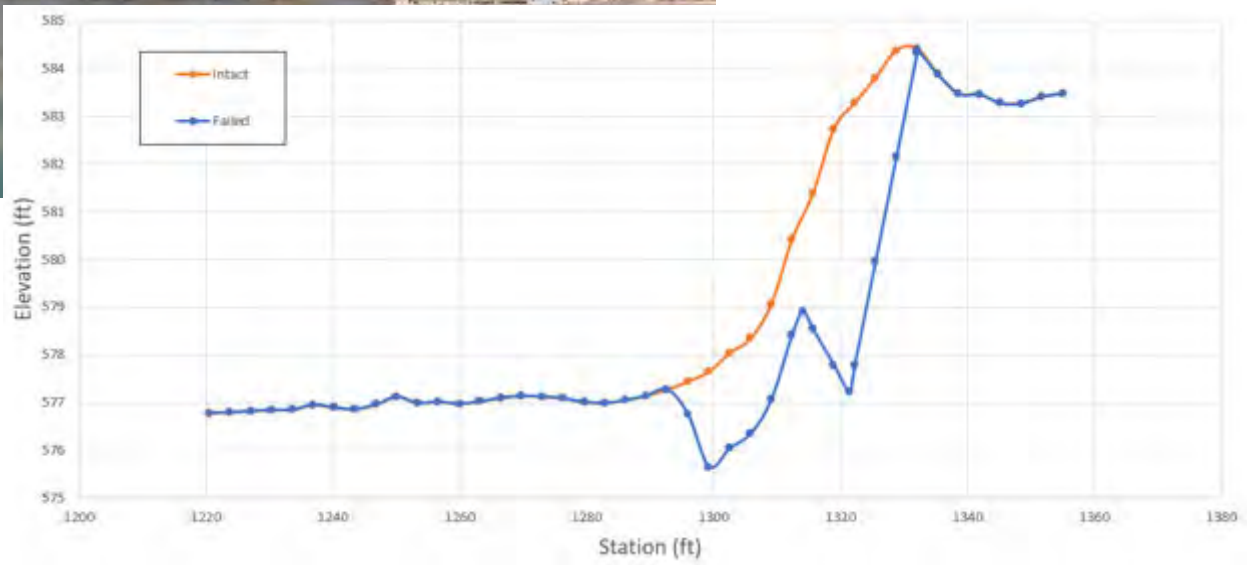
- Erosion analysis applied for sandy beach transects with gradual slopes.
- Eroded profiles are calculated using the USACE CSHORE model for each storm event.
- Influences wave setup, runup, and overtopping by affecting profile slope.

Alpena Analytical Transect 45



Step 2: Failed Structure Profiles

Alpena Transect 14



Step 2: Transect Analysis: Wave Setup and Runup

- Wave runup is the uprush of water from wave action on a beach or shore barrier such as a steep dune, bluff or coastal structure.
- Runup was calculated for every time step of each of the 151 storm events at each transect for the response-based approach.
- A statistical analysis was performed on the maximum runup results at each transect to obtain the 1-percent-annual-chance runup elevation.

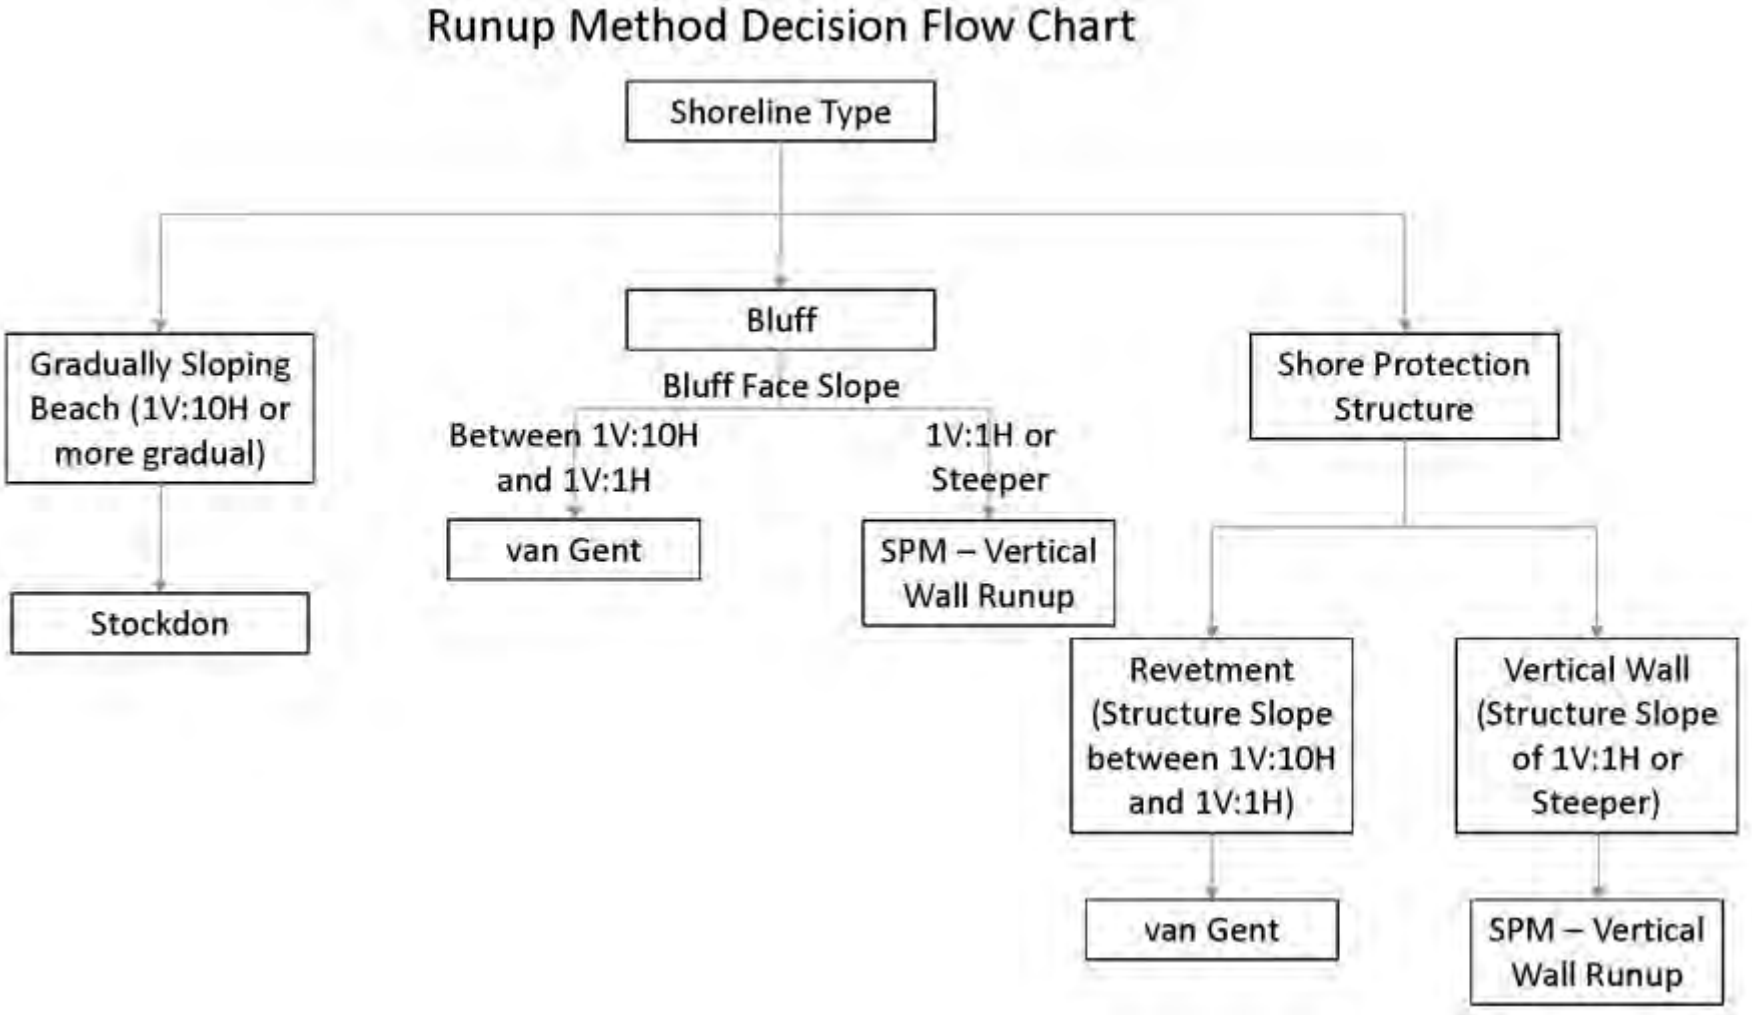
Wave Setup
Wave Runup

Response-Based Wave Runup



Step 2: Runup

http://www.mlive.com/expo/erry-2018/04/33c5eb88b72690/heres_a_look_at_how_michigan_r.html
http://machicon-akihabara.info/2017eimage-estuarine-floods.awp

Step 2: Transect Analysis: Wave Overtopping

- If wave runup exceeds the barrier crest elevation, overtopping occurs.
- Overtopping rates are calculated using methods described in the EurOTop Manual
- Overtopping rates determine VE splash zones and AO Zone (sheet flow) depths

Step 2: Wave Overtopping

https://www.youtube.com/watch?v=2N6SYWuP9p0

https://www.youtube.com/watch?v=iLmbBJLBDBs

Step 2: Wave Overtopping – Plateau Method

- When overtopping occurs, the zone behind the barrier is designated as:
  - AE if landward slope is positive
  - AO if landward slope is negative
  - AH if landward slope is negative and flow cannot drain
- Inland extent of overtopping mapping generally follows the 1-percent-annual-chance BFE contour
- Plateau method allows for an inland limit of runup to be calculated as the AE zone extent for gradually sloping upland areas behind a steep barrier

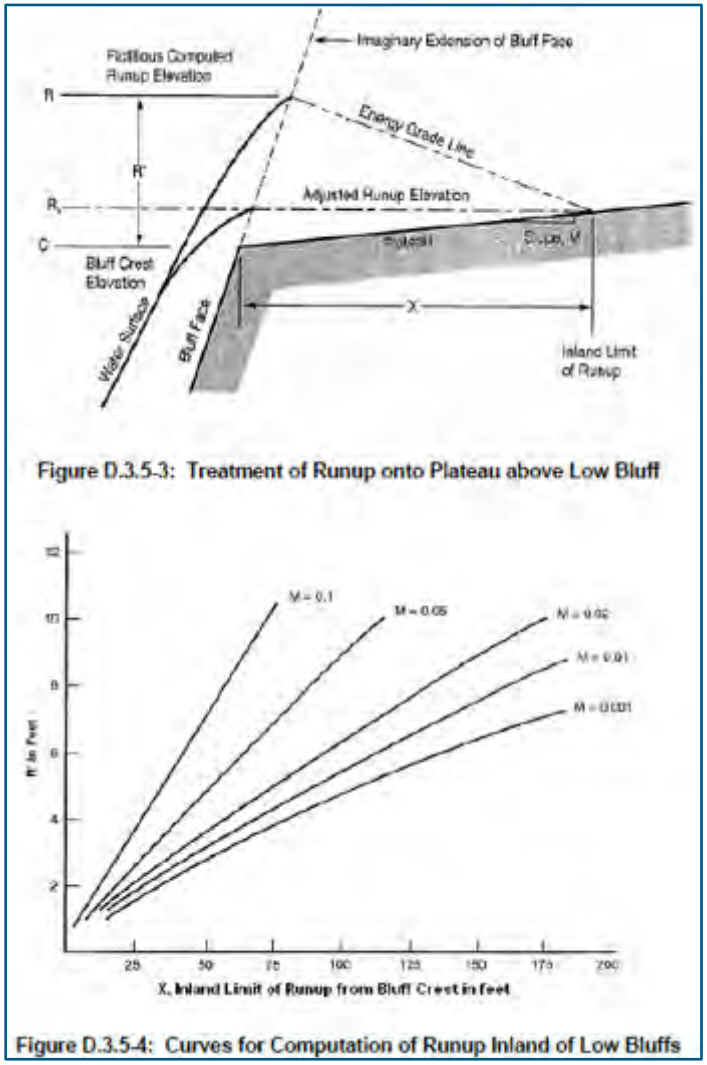


Figure D.3.5-3: Treatment of Runup onto Plateau above Low Bluff

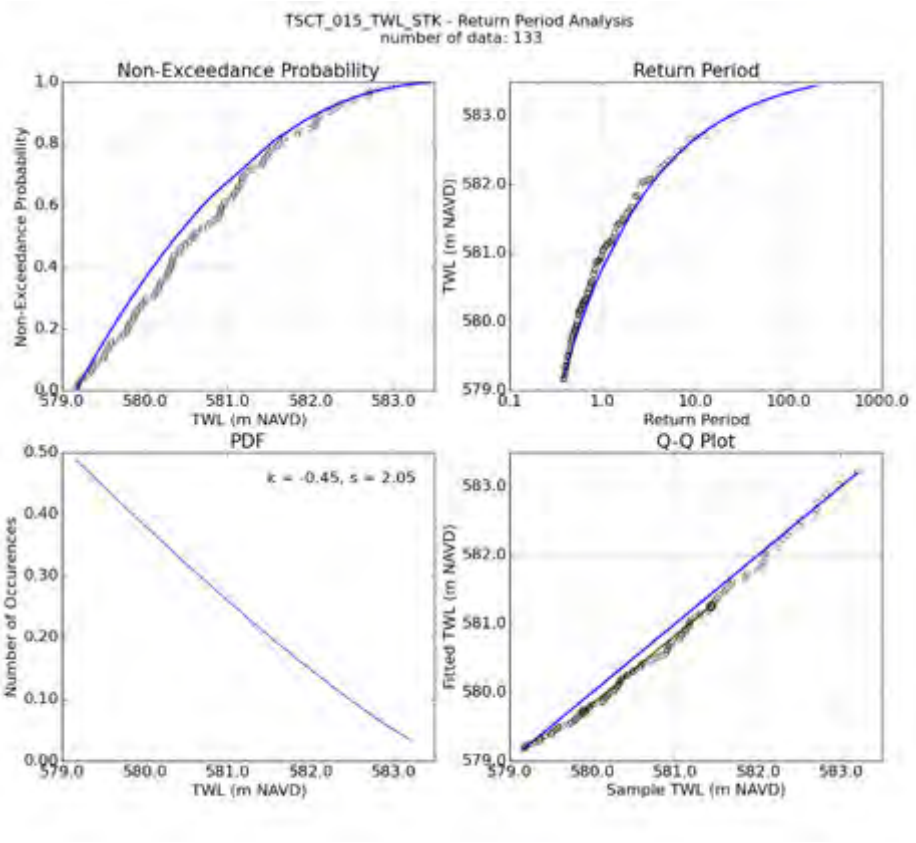
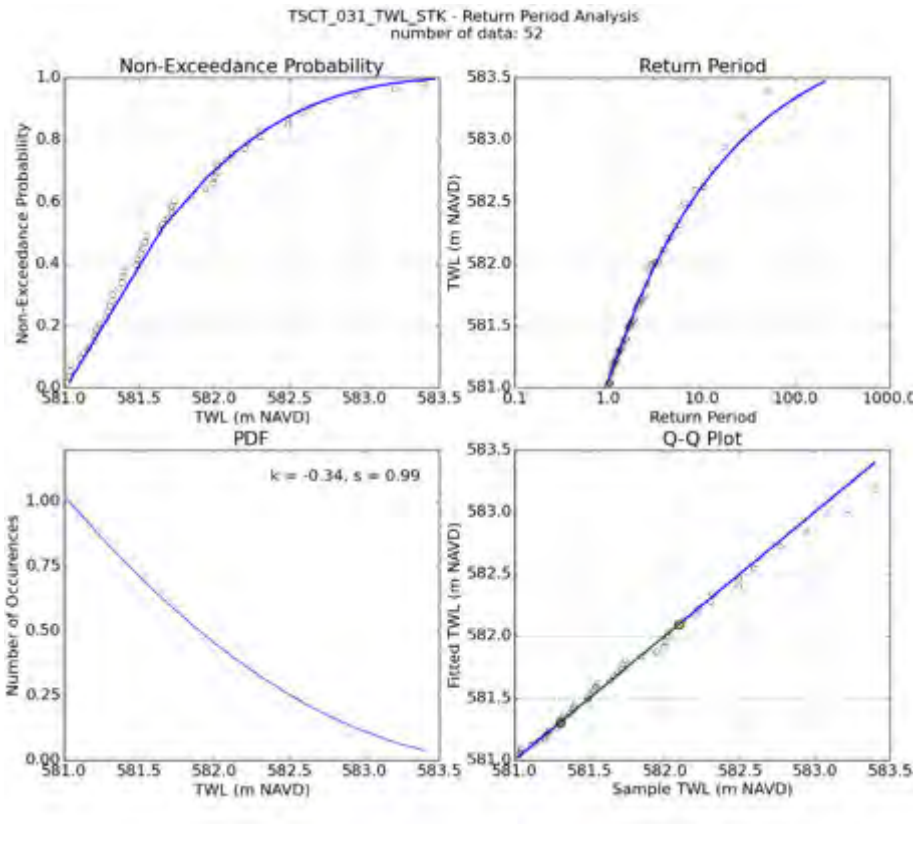
Figure D.3.5-4: Curves for Computation of Runup Inland of Low Bluffs

Step 2: Compute Setup, Runup, and Overtopping

- 151 storms with hourly waves and water levels yields hourly wave setup, runup and overtopping rates
- Hourly Still Water Levels (SWELs)
- Hourly Water Levels + Setup + Runup = Hourly Total Water Levels (TWLs)
- Extract the Peak SWEL and TWL from each storm
- Perform Return Period Analysis on SWEL and TWL
- 1-percent-annual-chance TWEL is used to define the Base Flood Elevation (BFE)

Step 2: Return Period Analysis





Alpena County, analytical transects 15 and 31

Step 2: Overland Wave Propagation

- Waves will propagate overland at areas where 1-percent still water level inundates far inland
- Overland wave propagation was modeled using event-based approach with synthetical storms determined by JPM analysis
- WHAFIS simulates inland wave propagation, dissipation due to obstructions, and wave regeneration

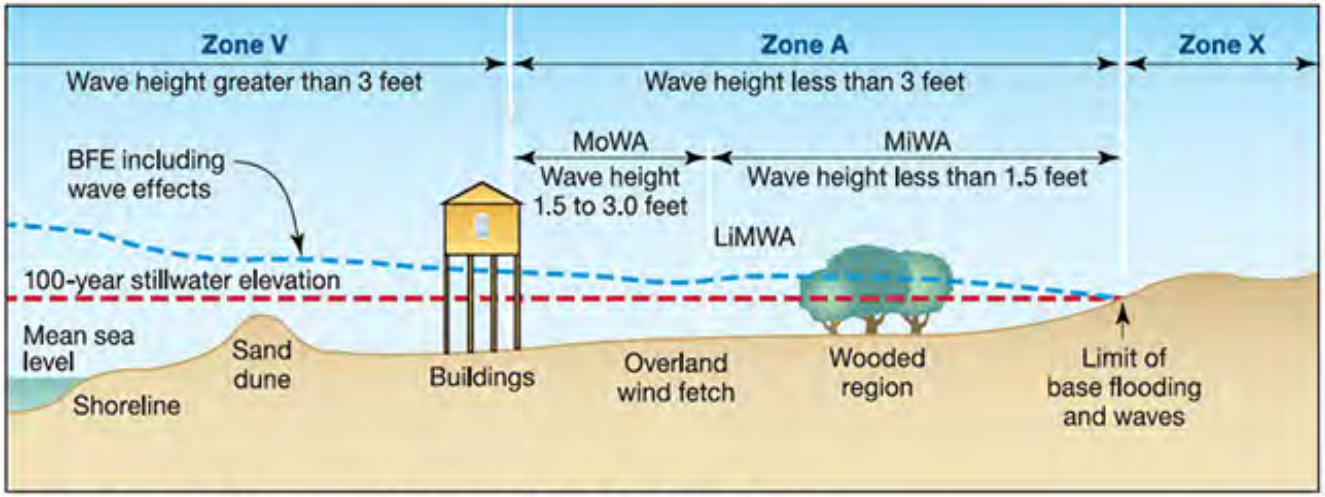


Figure 2-4. Wave height transect showing LiMWA, MoWA, and MiWA

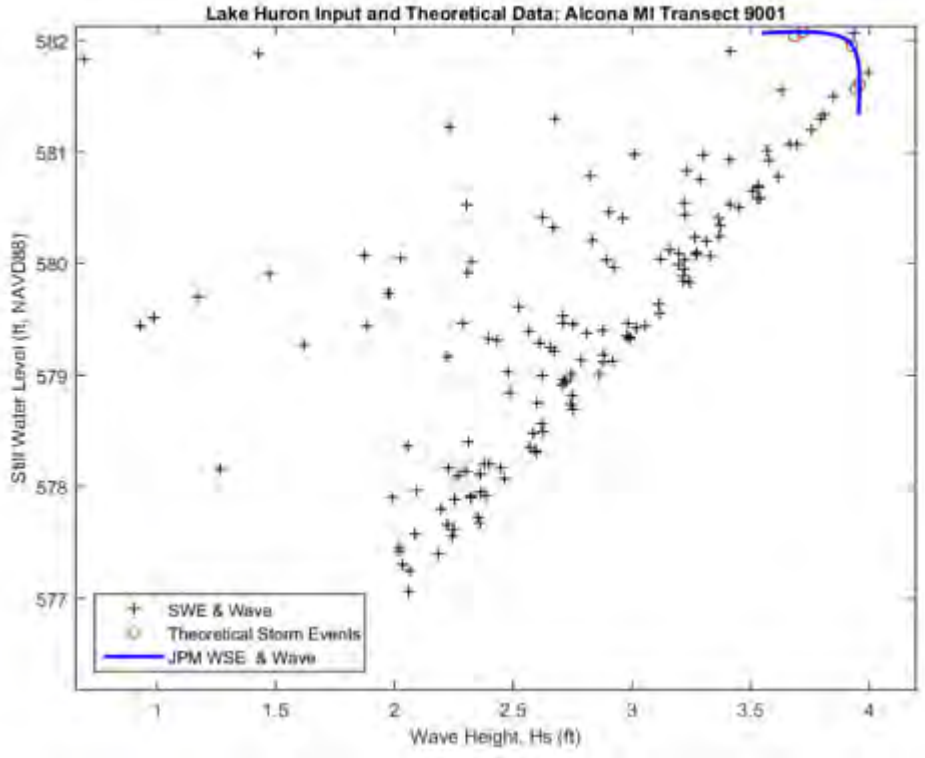
Step 2: JPM Analysis

- Joint Probability Method looks at the joint probability between peak wave height and water level of all historical storm events
- Five 1-percent events were determined corresponding to:
  - ❖ Max Hs and expected SWEL
  - ❖ Max SWEL and expected Hs
  - ❖ Intermediate SWEL and Hs
  - ❖ 1% SWEL and conditional Hs
  - ❖ 1% Hs and conditional SWEL

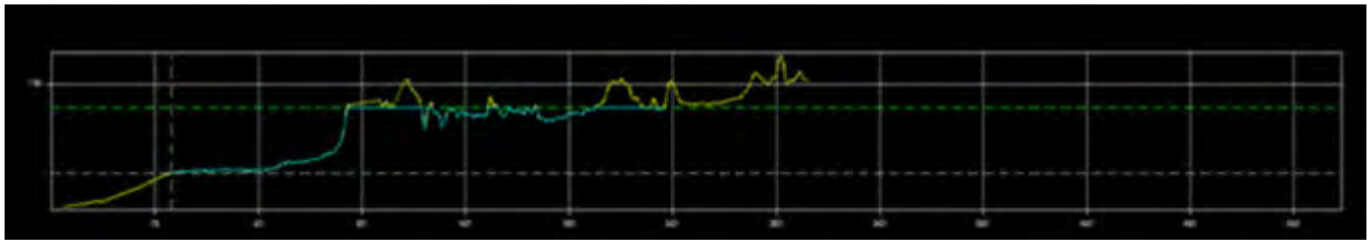


Step 2: WHAFIS Modeling

- Physical Setup: Transect profile with WHAFIS Carding

Card	Description
OF, IF	Overwater Fetch, Inland Fetch with 40 mi/hr wind associated with 1% event for wave generation
VH, VE	Marsh Grass, Rigid Tree line for wave dissipation
DU, BU	Obstruction due to Barriers, Building for wave dissipation

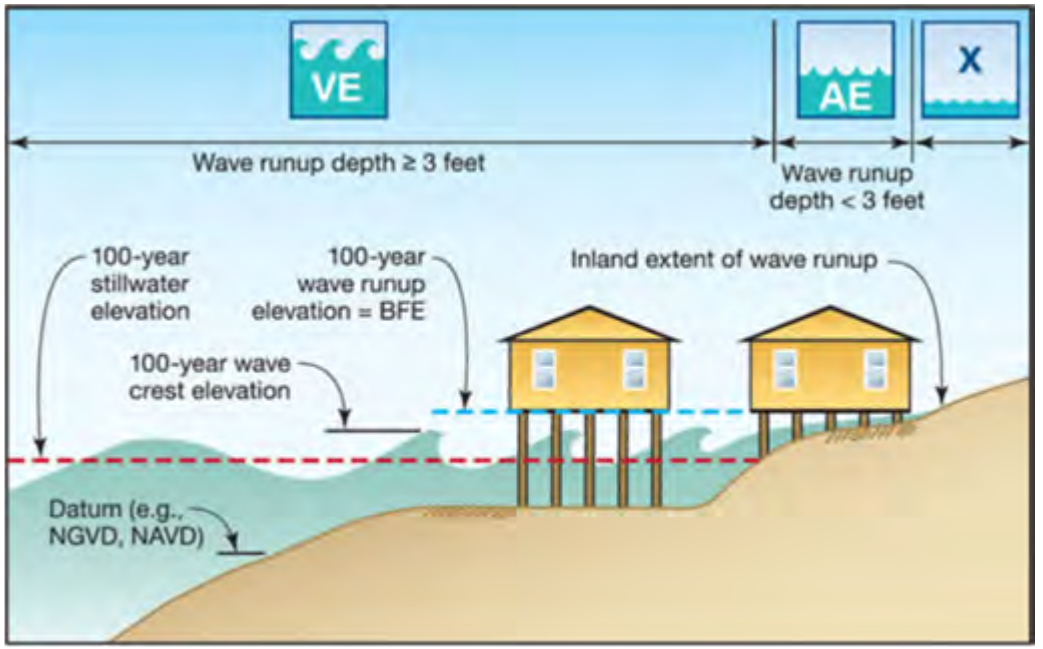
- Forcing Condition: Apply the maximum TSWL (SWEL + Wave Setup) and Hs from the 5 JPM storm events
- Model Output: Cross-shore wave height profile



Step 3: Mapping

Coastal Flood Hazard Zones

- Zone VE:
  - Represents coastal high hazard areas
  - Wave heights ≥ 3ft
  - Wave runup ≥ 3ft above ground elevation
  - BFEs are assigned
- Zone AE:
  - Inundation areas
  - Wave heights < 3ft
  - Wave runup < 3ft above ground elevation
  - BFEs are assigned
- Zone AH:
  - Ponding areas with 1-3 ft depths
  - BFEs are assigned
- Zone AO:
  - Applied in areas of sheet-flow shallow flooding
  - Designated with depths of 1-, 2-, or 3-ft
- Zone Shaded-X:
  - Areas impacted by the 0.2-percent-annual-chance event



FEMA

RiskMAP
Increasing Resilience Together

Step 3: Zone Breaks

- Zone breaks are placed along the coast where the characteristics of the shoreline transition from one shore type to another
- Define the extents of each representative shoreline reach

Step 3: Runup VE Zones

- Intact transects
  - VE zone mapped to elevation associated with TWL or structure crest elevation
- Failed transects (coastal structures)
  - VE zone mapped to station along the profile associated with TWL
  - Elevation may not match topography since mapping extent is associated with failed structure elevation
- Eroded profiles
  - VE zone mapped to station along the profile associated with TWL
  - Elevation may not match topography since mapping extent is associated with the eroded profile elevation

Step 3: Overtopping Zones

AO Zones

- Applied in areas of shallow flooding, usually sheet flow on sloping terrain

AH Zones

- Applied in areas of ponding

Step 3: Overland Wave Propagation

Step 3: SWEL Inundation

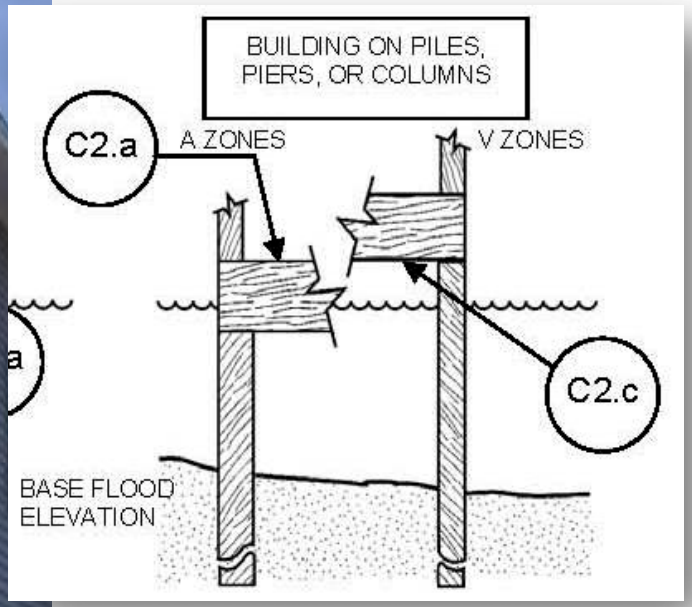
FEMA FLOODPLAIN MANAGEMENT

V-zone Floodplain management : 44 CFR 60.3(e)

The community must require that all new construction and substantial improvements have the lowest horizontal structural member of the lowest floor elevated to or above the base flood level,

> … with the space below the lowest floor either free of obstruction or constructed with non-supporting breakaway walls …

Lowest horizontal structural member



Other key points in Zone VE:

- NO USE OF FILL as structural support
- Elevated portion of the building and piling/column foundation must be designed to withstand water and wind loads acting simultaneously under base flood conditions

NEXT STEPS

Next Steps

60 day review and comment period ends July 30, 2018.

FEMA's next steps:

1. Inventory all comments received
2. Evaluate and incorporate comments and data as appropriate
3. Move studies into the NFIP regulatory process (developing FIRMs)

Comments

Send comments via email to matt.bauer@stantec.com or mail to:

6110 Frost Place
Laurel, MD 20707

Include county, community, map panel number, description of area (screenshots or drawings are very helpful), detailed comment, and contact information

- You will receive acknowledgement of receipt of your comment within 3 business days
- Within 3 weeks, FEMA's response will indicate if enough technical justification was provided to necessitate a map change
- If you are not satisfied with a comment response on technical grounds, consider using the appeal process during Preliminary FIRM rollout
